

The Project Passport: Guapurri

Chapter 1: Vision, Tech Stack, and MoSCoW priorities

- **The Vision:** A simple app to check live weather and see what clothes to wear. It helps users who don't know what outfit to pack or wear just by looking at temperature numbers.
 - **Tech Stack:** Built for iOS mobile using **Base 44** (the AI app creation tool) and real-time weather data.
 - **Priorities (MoSCoW):**
 - *Must-Have:* Real-time weather search and clothing recommendations with outfit photos.
 - *Should-Have:* Google Log In and language options (English as default).
 - *Could-Have:* A colorful, easy-to-use design with a "Travel" search category.
-

Chapter 2: Core Logic (The Engine)

- **How it Works:** The app takes the city name you type and instantly gets the current live weather.
 - **The Smart Steps:**
 1. It checks the live degrees.
 2. It matches the degrees with a photo of the perfect outfit (like a jacket for cold weather or a t-shirt for heat).
 3. It filters holiday destinations based on the season you choose.
-

Chapter 3: System Architecture (The Map)

- **The Journey of data:**
 - **User Input:** You type a city or choose a climate (like "Dry Desert").
\$\\rightarrow\$
 - **Base 44 AI Logic:** The app processes the search and connects it to the live weather system. \$\\rightarrow\$
 - **Visual Output:** The screen shows you the exact temperature, the outfit picture, and travel recommendations without crashing.
-

Chapter 4: The Bug Log (Testing & QA)

- **The Big Problem:** When testing the travel tab, combining "Dry Desert" with "Winter" caused the app to freeze and load forever. The AI could not find the right places, blocking the "Wear an Outfit" and "Travel" buttons.
 - **The Solution:** I changed the instructions inside the Base 44 AI code. I taught it how to handle these specific climate mixes.
 - **The Result:** The app passed all tests. You can now switch between tabs and search any climate smoothly.
-

Chapter 5: Technical Audit (Reflections on logic)

- **What Went Well:** Using Base 44 allowed for quick design updates and easy Google sign-in integration. The final app is colorful, fast, and works perfectly.
- **Lessons Learned:** AI tools can get confused with very specific search combinations (like winter in a dry desert). To fix this, you must give the AI clearer rules so the application code does not crash.
